YASHWANTH RAJ CHERUKURU

Full-Stack Developer | UI/UX for Web & Mobile Apps

cherukuriyashwanthraj@gmail.com | github.com/yashwanth-1729 | India · Open to remote freelance & internships

SUMMARY

Computer Science undergraduate who designs and builds complete products, from polished, animated interfaces to the APIs and databases behind them. Shipped a voice-first assistant for Windows and Android with a full onboarding flow, personality-driven copy and live 3D mascot, plus booking, tournament and encrypted-sync systems. Focused on interfaces people enjoy using and backends that don't break.

TECHNICAL SKILLS

UI / UX: Onboarding flows, animated dashboards, gesture-driven interactions, micro-interactions, responsive mobile-first layouts, UX copywriting, reduced-motion accessibility

Frontend: React, Next.js, TypeScript, JavaScript, Three.js

Backend & data: Node.js, FastAPI, Python, REST APIs, PostgreSQL, SQL, Supabase, IndexedDB

Engineering: Web Crypto API, streaming audio, webhooks, Vitest, Git

SELECTED PROJECTS

JARVIS: Voice-First AI Assistant FLAGSHIP UI GitHub

Next.js, React, FastAPI, Three.js

Personal assistant for tasks, schedules, memory and chat, packaged for Windows and Android.

- Designed and built a multi-step conversational onboarding with a live progress bar, swipeable “personality” cards, interest chips, time sliders and a weekly study-block planner.
- Created a Three.js mascot whose expressions react to live session state, including a distinct red “lock-in” commitment mode, plus localized options in English, Telugu and Hinglish.
- Built the home dashboard, notification-permission flow and tiered pricing screens with a consistent design system and reduced-motion support.
- Instrumented per-stage voice latency, benchmarked model and speech options, and implemented streaming audio with ordered playback and bounded backpressure.

Hospital Automation System GitHub

Next.js, TypeScript, PostgreSQL, Node.js

- Built patient and staff interfaces in Next.js, API webhooks, and a PostgreSQL-backed worker for booking, reminders and follow-ups.
- Implemented idempotent intake and transactional slot locking to prevent duplicate leads and double booking; tested the workflows with Vitest.

ClutchHub: Tournament Platform GitHub

Next.js, React, TypeScript, Supabase

- Built tournament creation, team registration, messaging, match scoring and live leaderboards.
- Moved backend operations into Next.js route handlers; added auth-based role checks, paginated APIs and server-side points calculation.

SLDT: Encrypted Cross-Device Sync GitHub

TypeScript, IndexedDB, GitHub API

- Designed a sync engine using AES-256-GCM encrypted records and HMAC-signed manifests over GitHub's Contents API, with IndexedDB persistence.
- Implemented deterministic conflict resolution, tombstone deletes and compare-and-swap retries; tested multi-device sync, corruption handling and race recovery.

EDUCATION

KL University | B.Tech in Computer Science (second year) — Expected 2029
